

initial configuration (once on your local machine)

1.

>> git config --global user.name "Your Name"-----why global and what else could be used instead of global?

>> git config --global user.email "your@email.com"

>> git config --global color.ui auto-----some example output of this

Pushing-----

1. Step 1: Create a New Repository on GitHub

2. Step 2: Open Terminal / Command Prompt (Make sure the path is correct)

>> cd path/to/your/project

3. Step 3: Initialize Git

>> git init----- (converts an existing folder into a Git repository)

4. Step 4: Add All Files- Moves file from Working Directory to Staging Area

>> git add . (Add all files)

5. Step 5: Commit the Files

>> git commit -m "Initial commit"----- descriptive message.

6. Step 6: Connect to GitHub Repository

>> git remote add origin <html path>

7. Step 7: Push to GitHub

>> git branch -M main

```
>> git push -u origin main
```

Cloning-----

1. Open repository.
2. Click on code button and copy url.
3. open terminal and navigate to desired directory.
4. >> git clone <url>
5. Enter the repository...(cd repository name)

Forking-----

1. Open the Repository.
2. On the top-right corner of the repository page- click Fork.
3. Select Your Account.
4. --Forked repo is created.
5. As a good practice, clone it and then experiment with it.

Pull request

- 1- Fork the Repository

-
- 2- Clone the Forked Repo (Local Machine pe)

```
git clone https://github.com/your-username/repo-name.git
```

cd repo-name

3- Upstream the Original Repo

git remote add upstream <path of original repo owner>

Check:

git remote -v

To set different origin-

git remote set-url origin <forked repo link>

4- New Branch

git checkout -b feature-update

code . --open vs code

5- Edit the code

Check:

git status

6- Changes Stage + Commit

git add .

git commit -m "type a message here"

7- Push it back to fork

git push origin feature-update

Note- To remove origin and add a new origin, follow this-

git remote remove origin

git remote add origin <path of forked repo--https://github.com/rkjune/jwt_auth_forked.git>

8- create Pull Request

Open your forked repo in your github account

click "Compare & pull request"

Base repo: original repo

Compare: your branch (feature-update)

Type -Title and description

Create Pull Request

9- Review & Merge (done by owner)
